

CHURN AT FIT.LY

Presentation

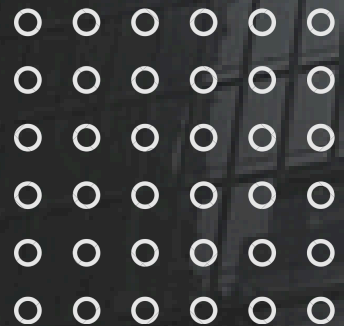

Project Overview & Business Goals

- Increase in customer churn over the past two quarters
- Rising cost of acquiring new users
- Growing importance of customer retention
- Objective: identify main drivers of churn
- Objective: propose practical actions to improve retention and reduce churn

Data Validation

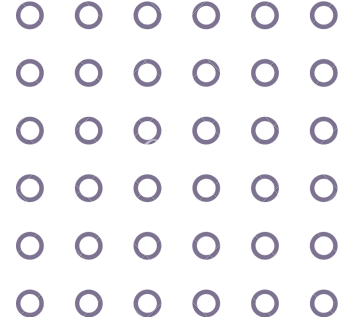

- Data from three sources: accounts, support, and activity tables
- Initial datasets contained inconsistencies, missing values, and formatting issues
- Standardized IDs, dates, and categorical fields for consistency across tables
- Cleaned and unified column formats
- Replaced missing or unclear values
- Renamed and recoded fields to improve clarity and usability in analysis
- Removed 43 users due to data deletion requests
- Final dataset used for analysis:

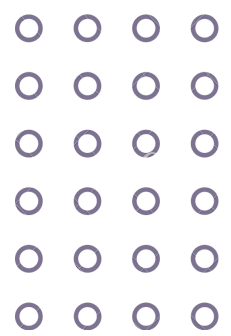

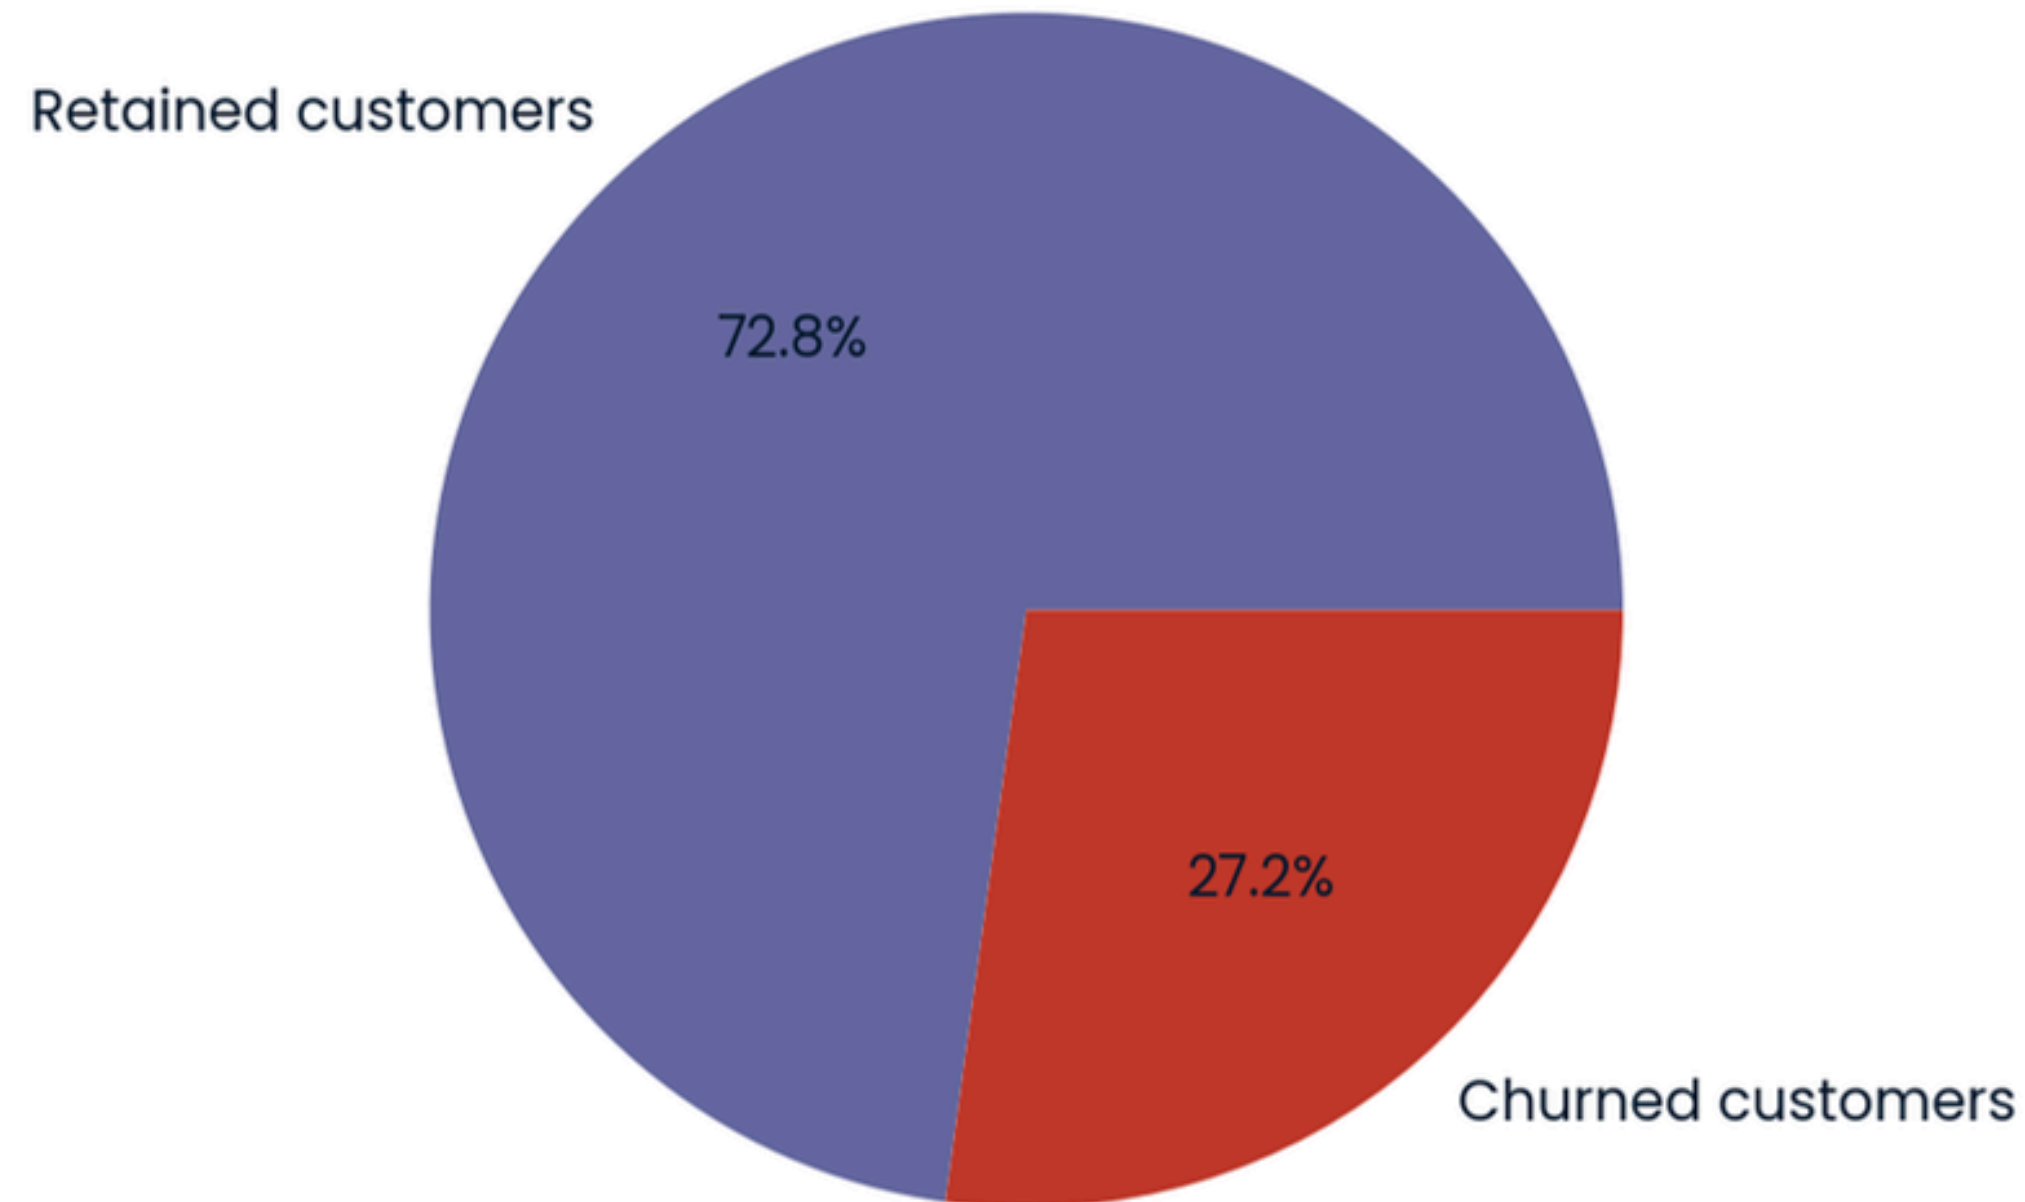

- 357 accounts
- 781 support records
- 401 activity records

```
ID format:      From this 'C10000' -> '10000'  
Text format:    From this 'watch_video' -> 'Watch Video'  
Date format:    From this 'object' -> 'datetime64[ns]'  
Category Format: From this '-' -> 'Unknown'
```

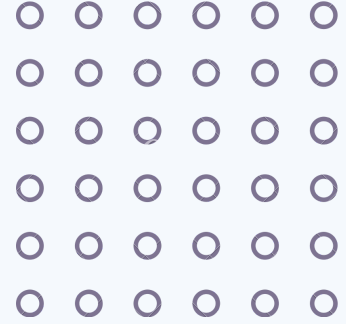

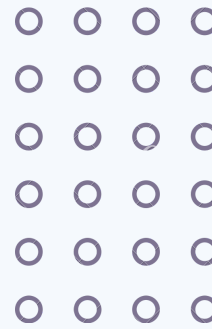

Customers distribution

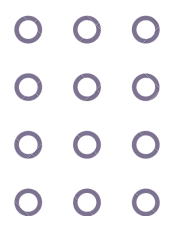

The churn rate is 27.2%, meaning that roughly every fourth customer leaves.

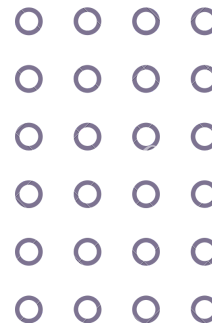

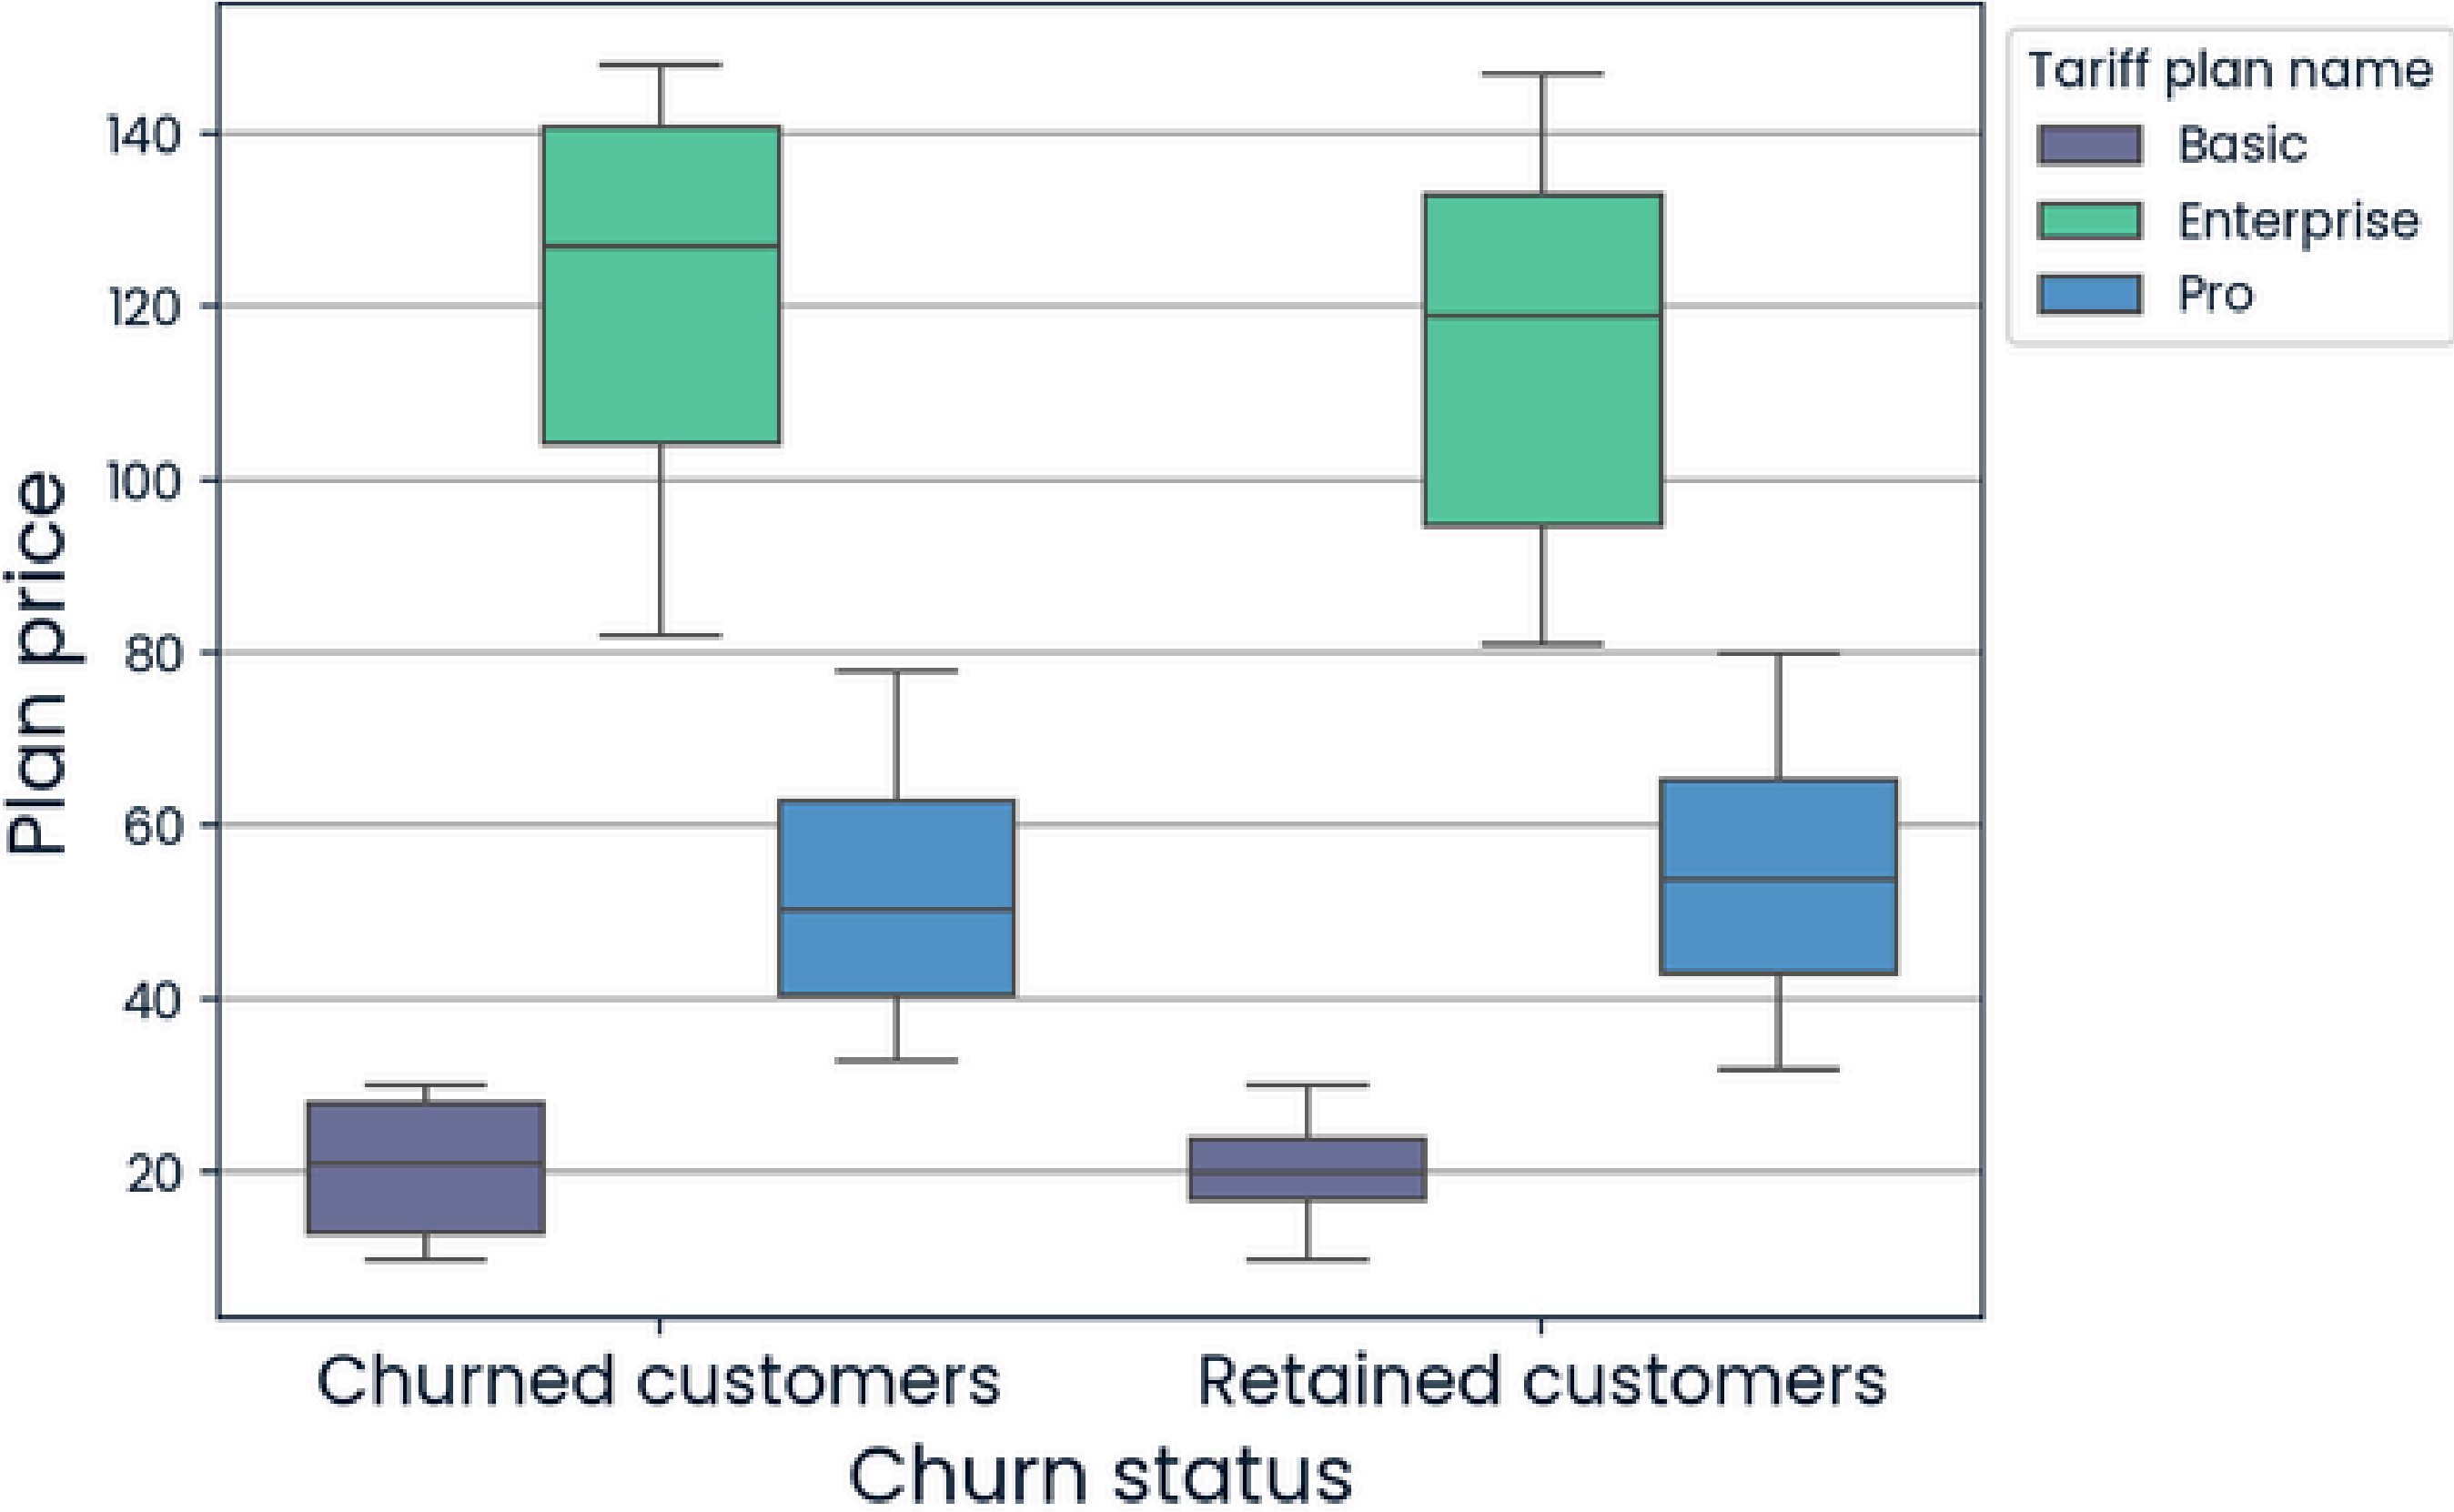

Distribution of churn by tariff plans

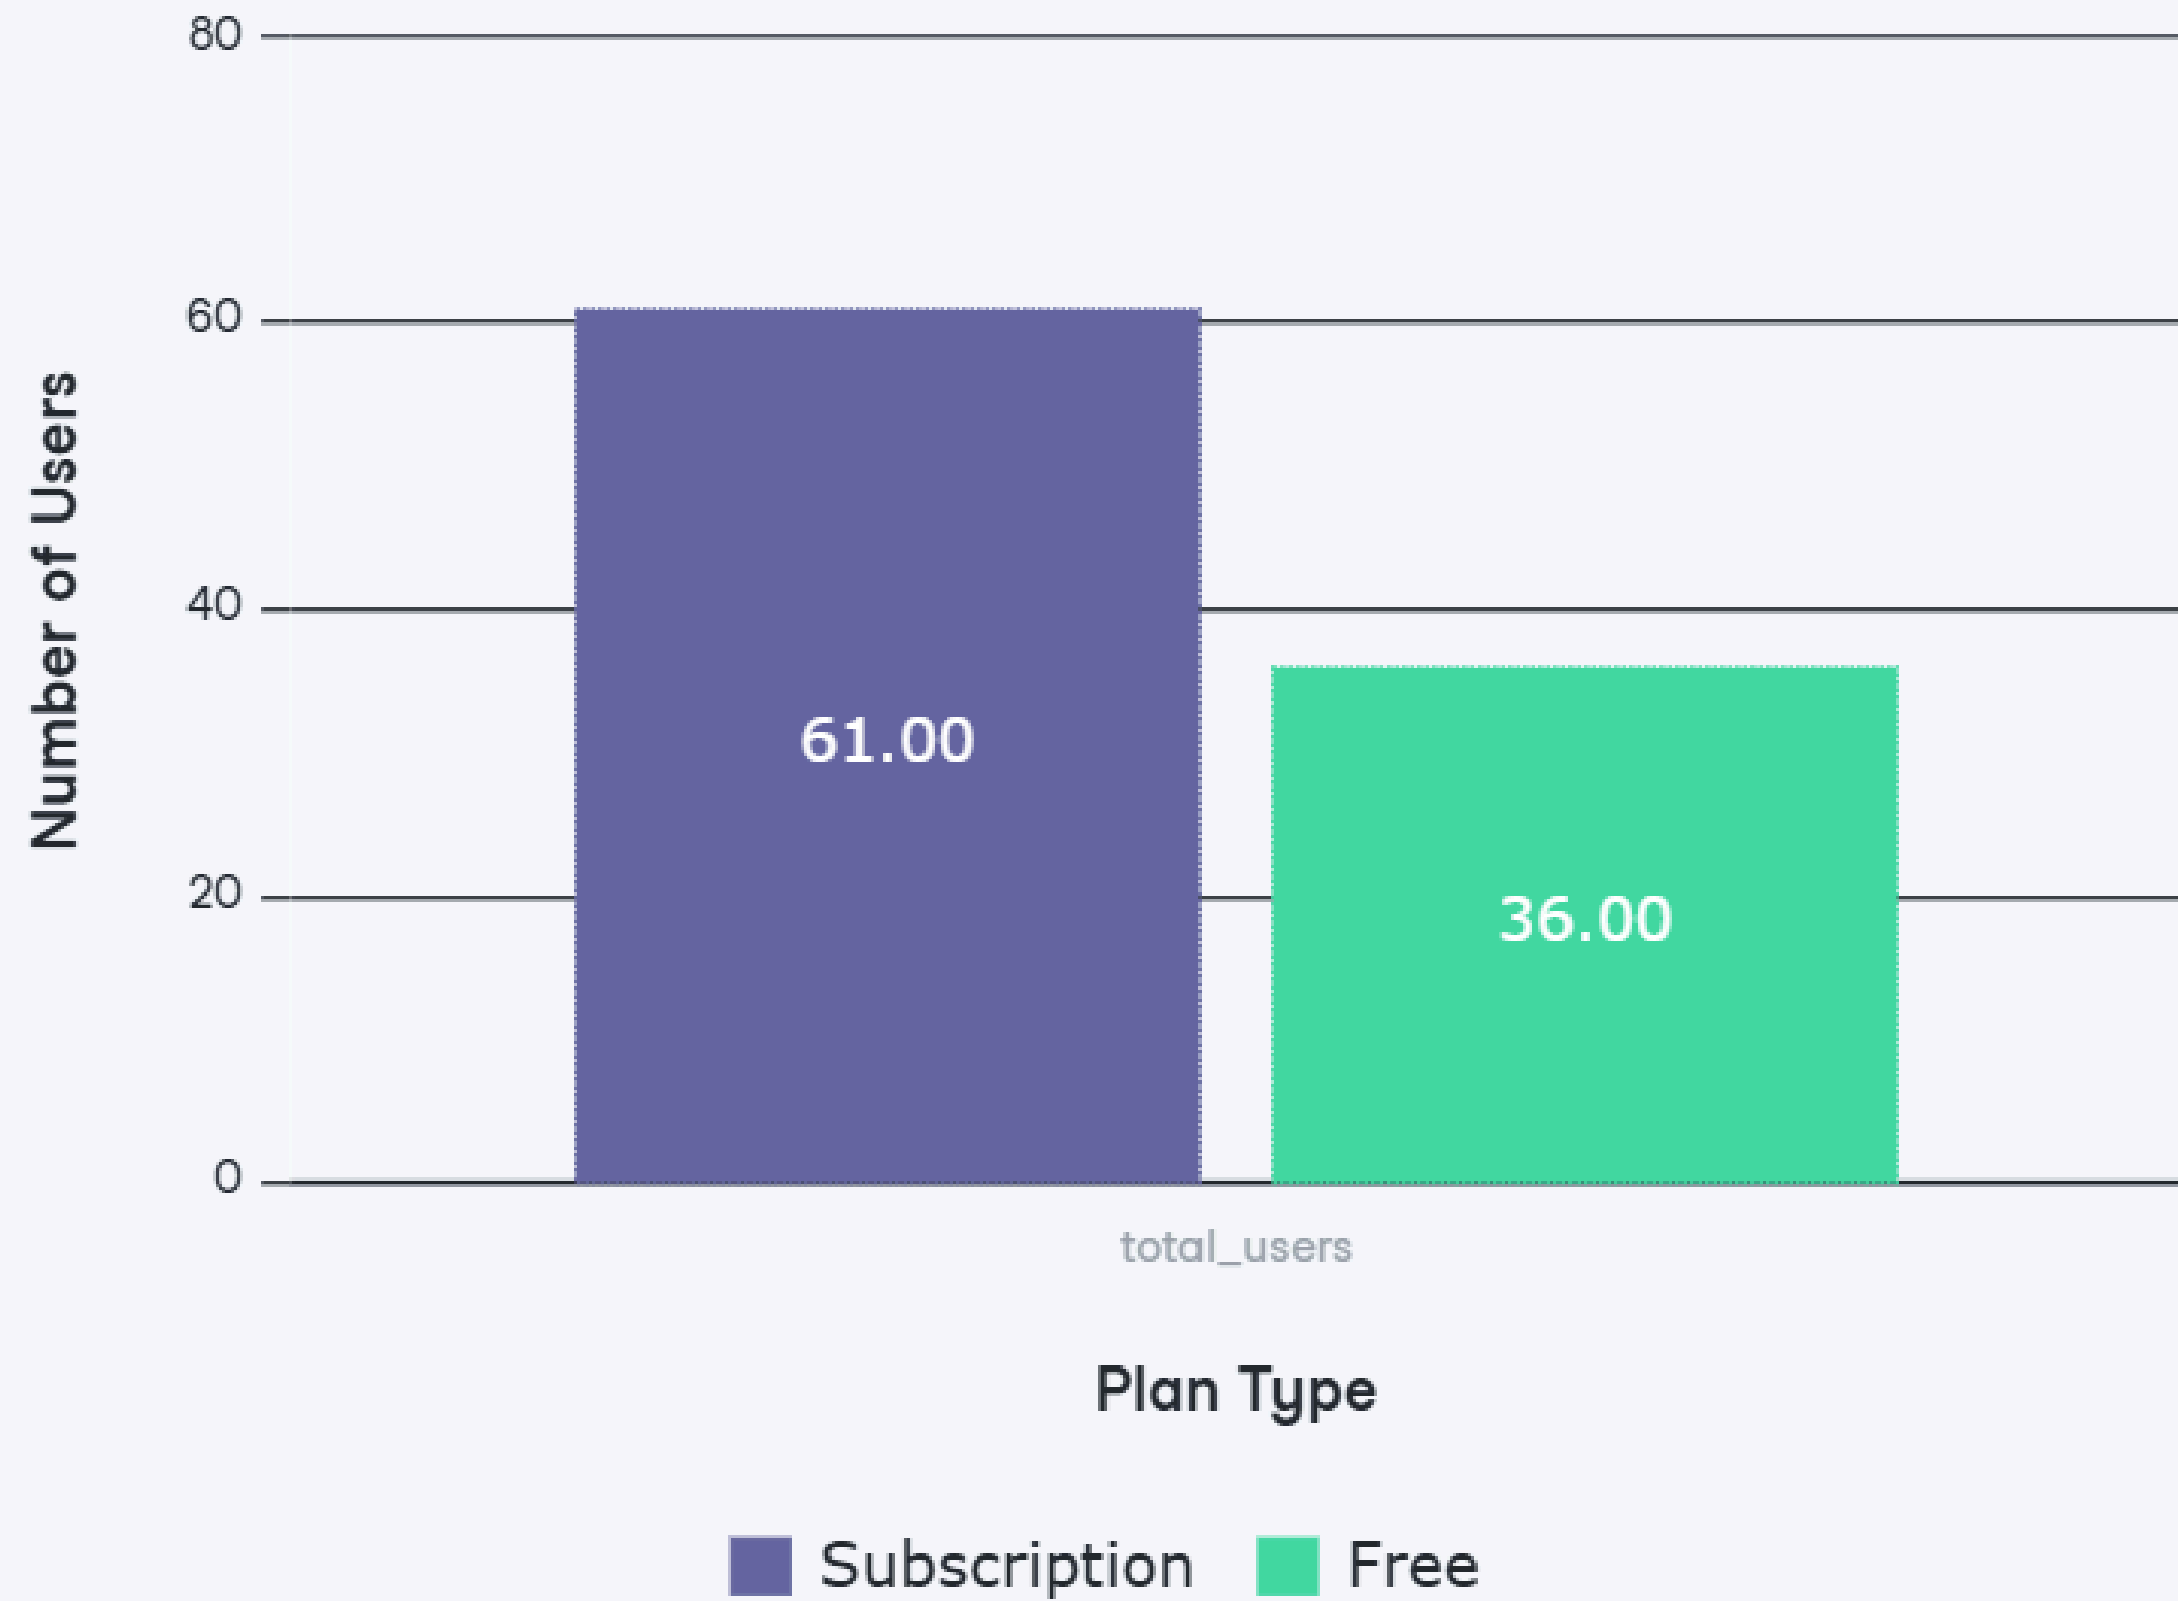

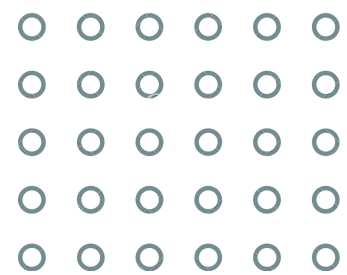

Price distribution: churned vs not churned (Subscription only)

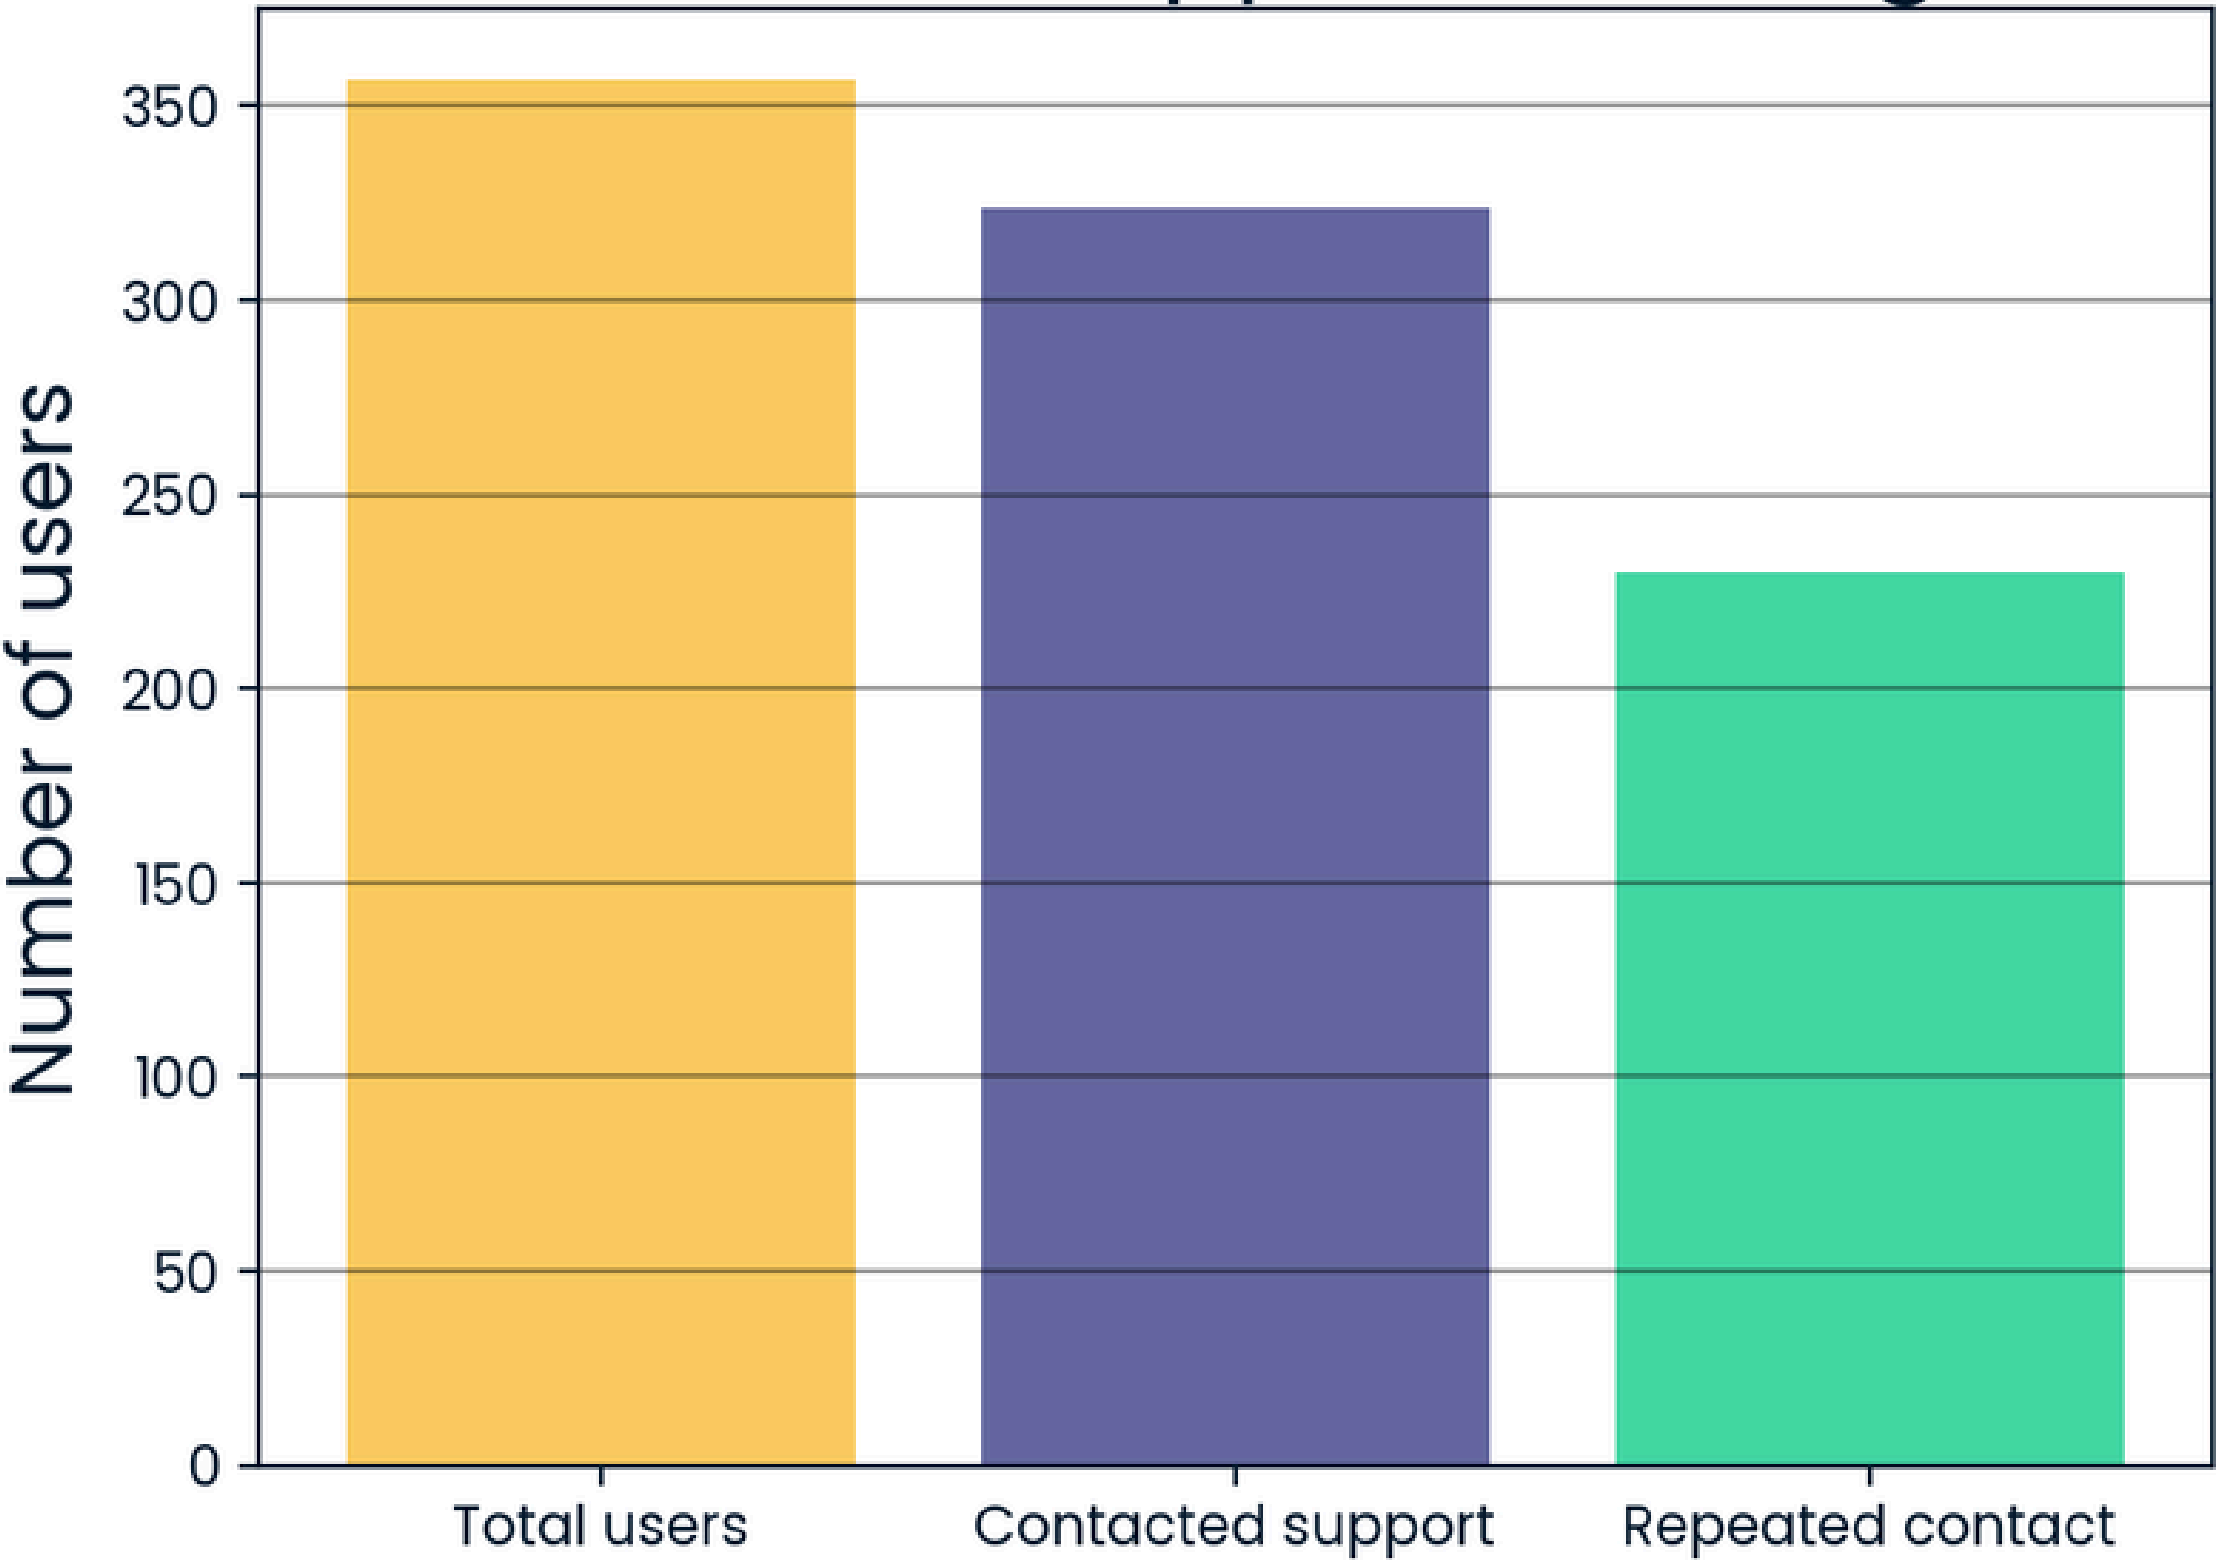

Churned Users by Plan Type

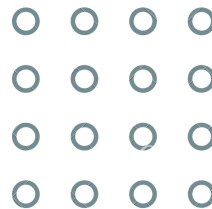

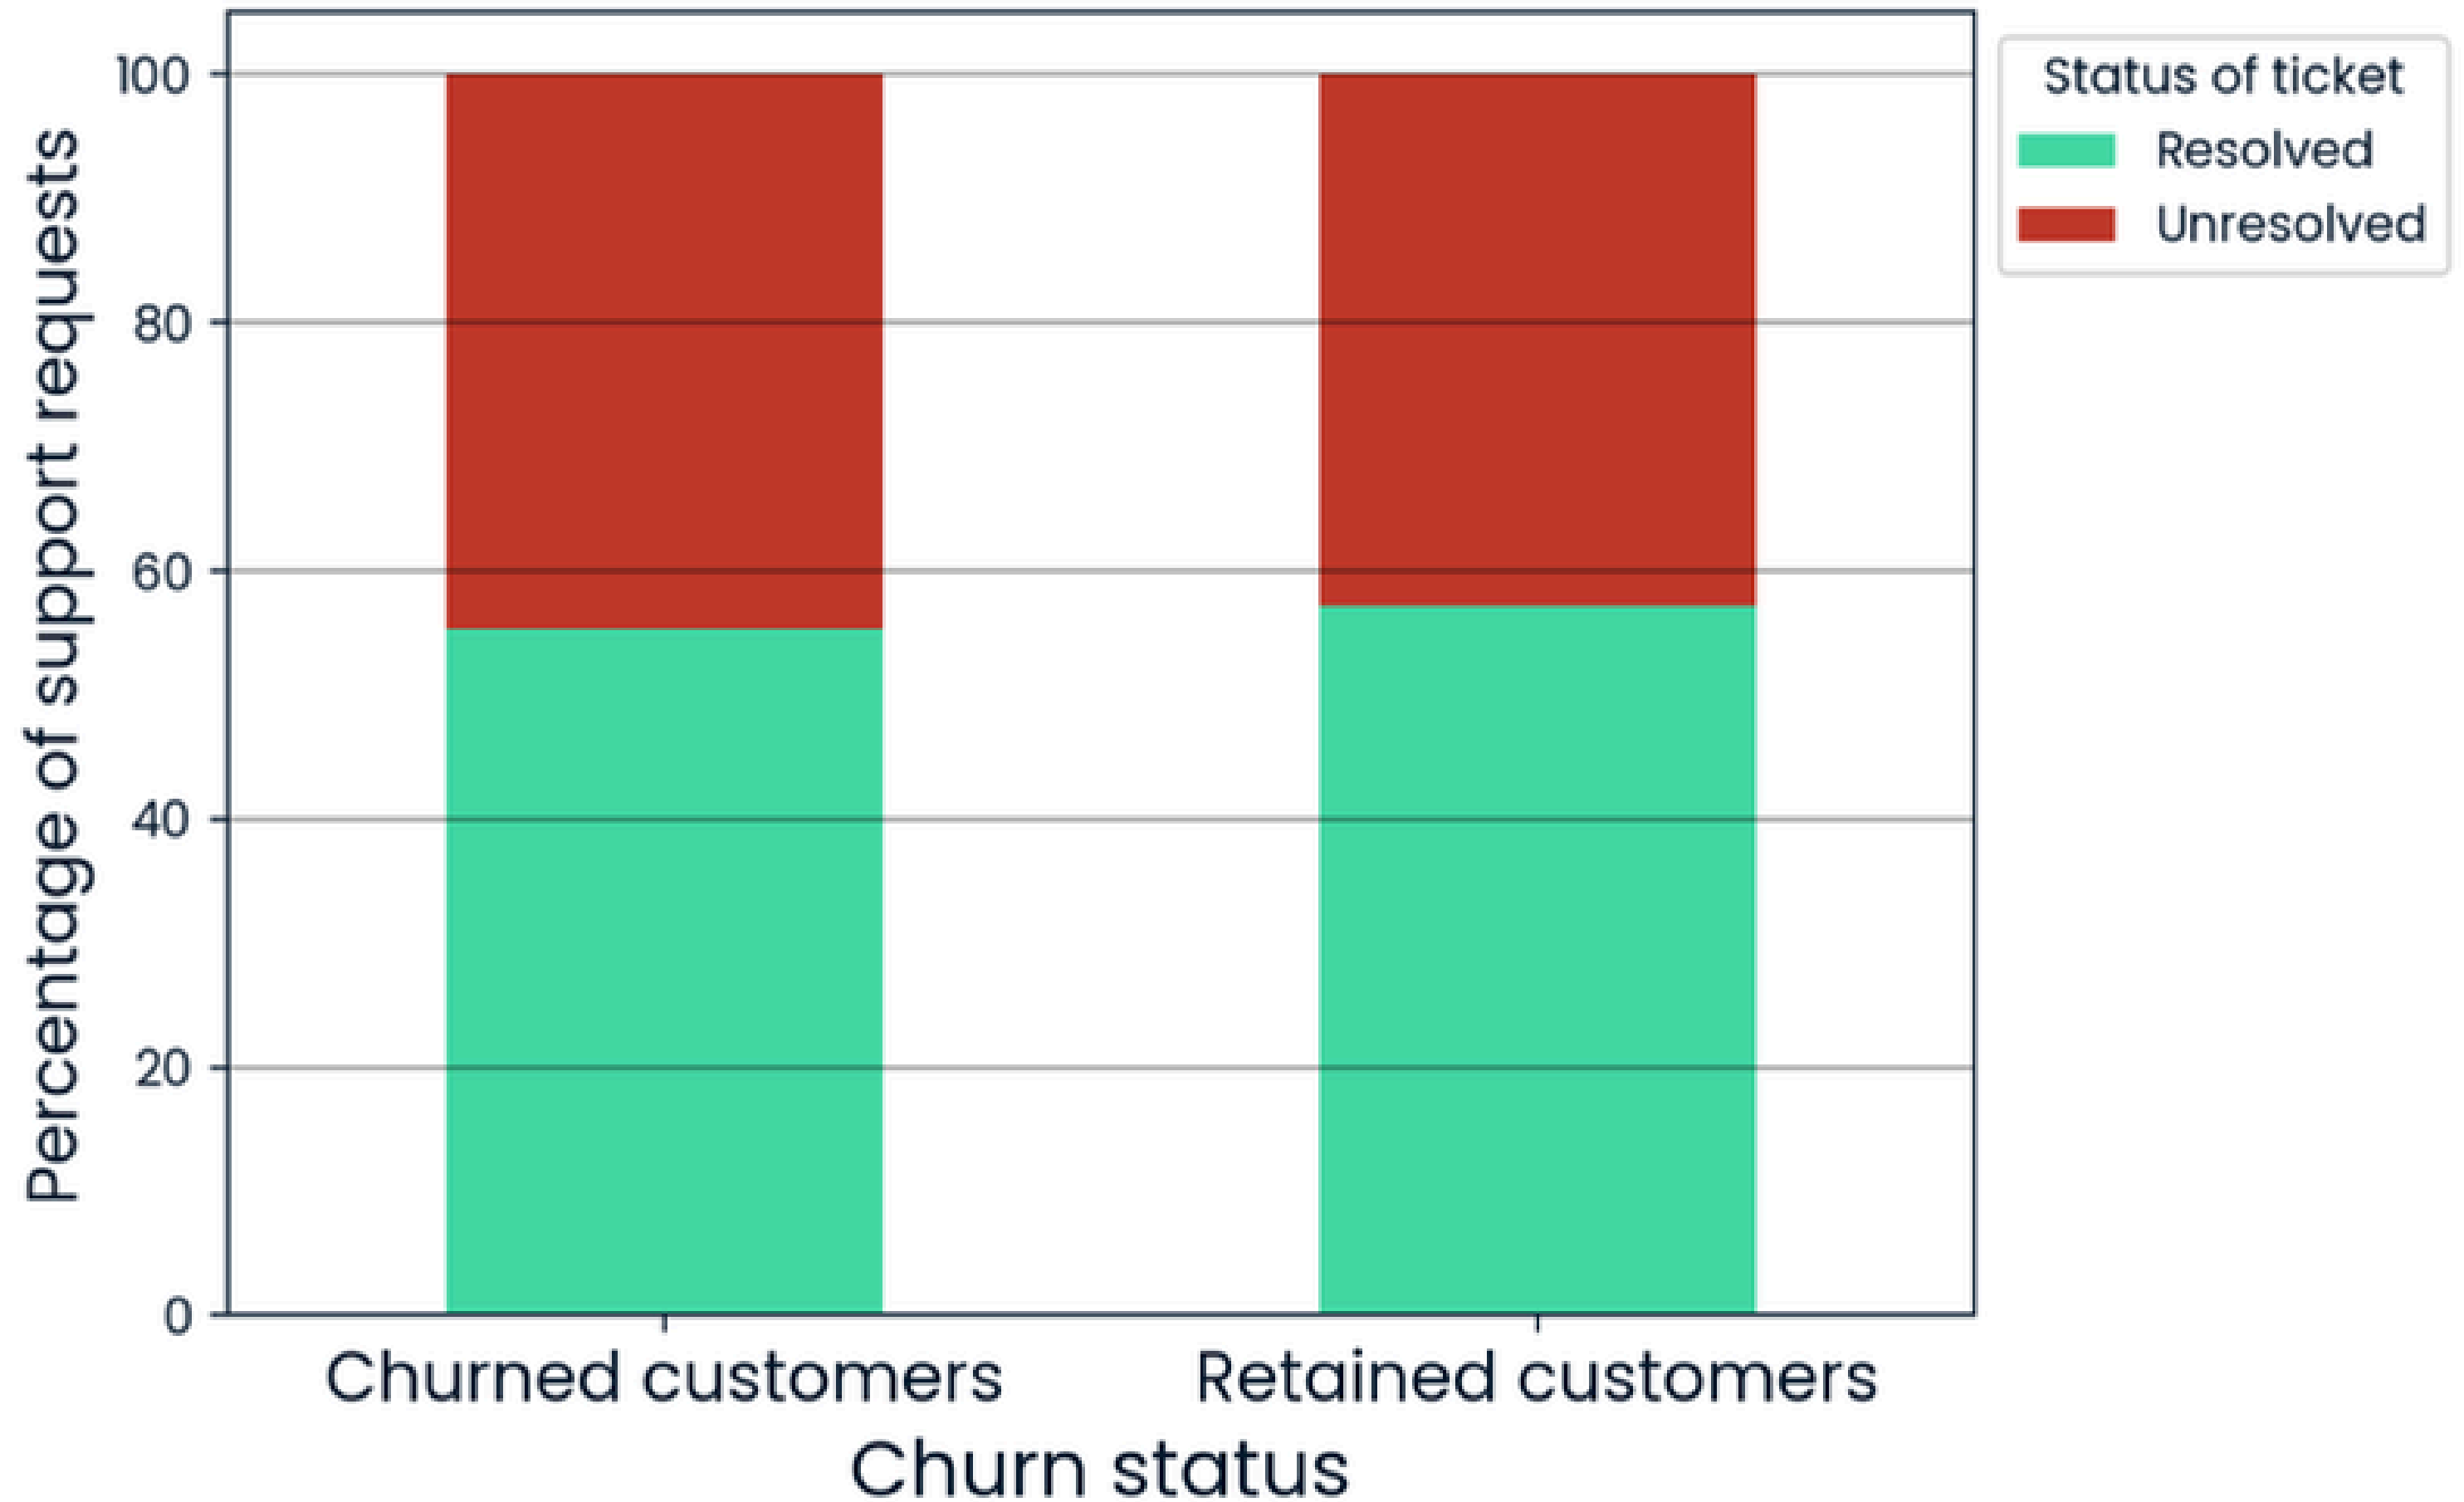

Customer support coverage

9 out of 10 users encounter difficulties

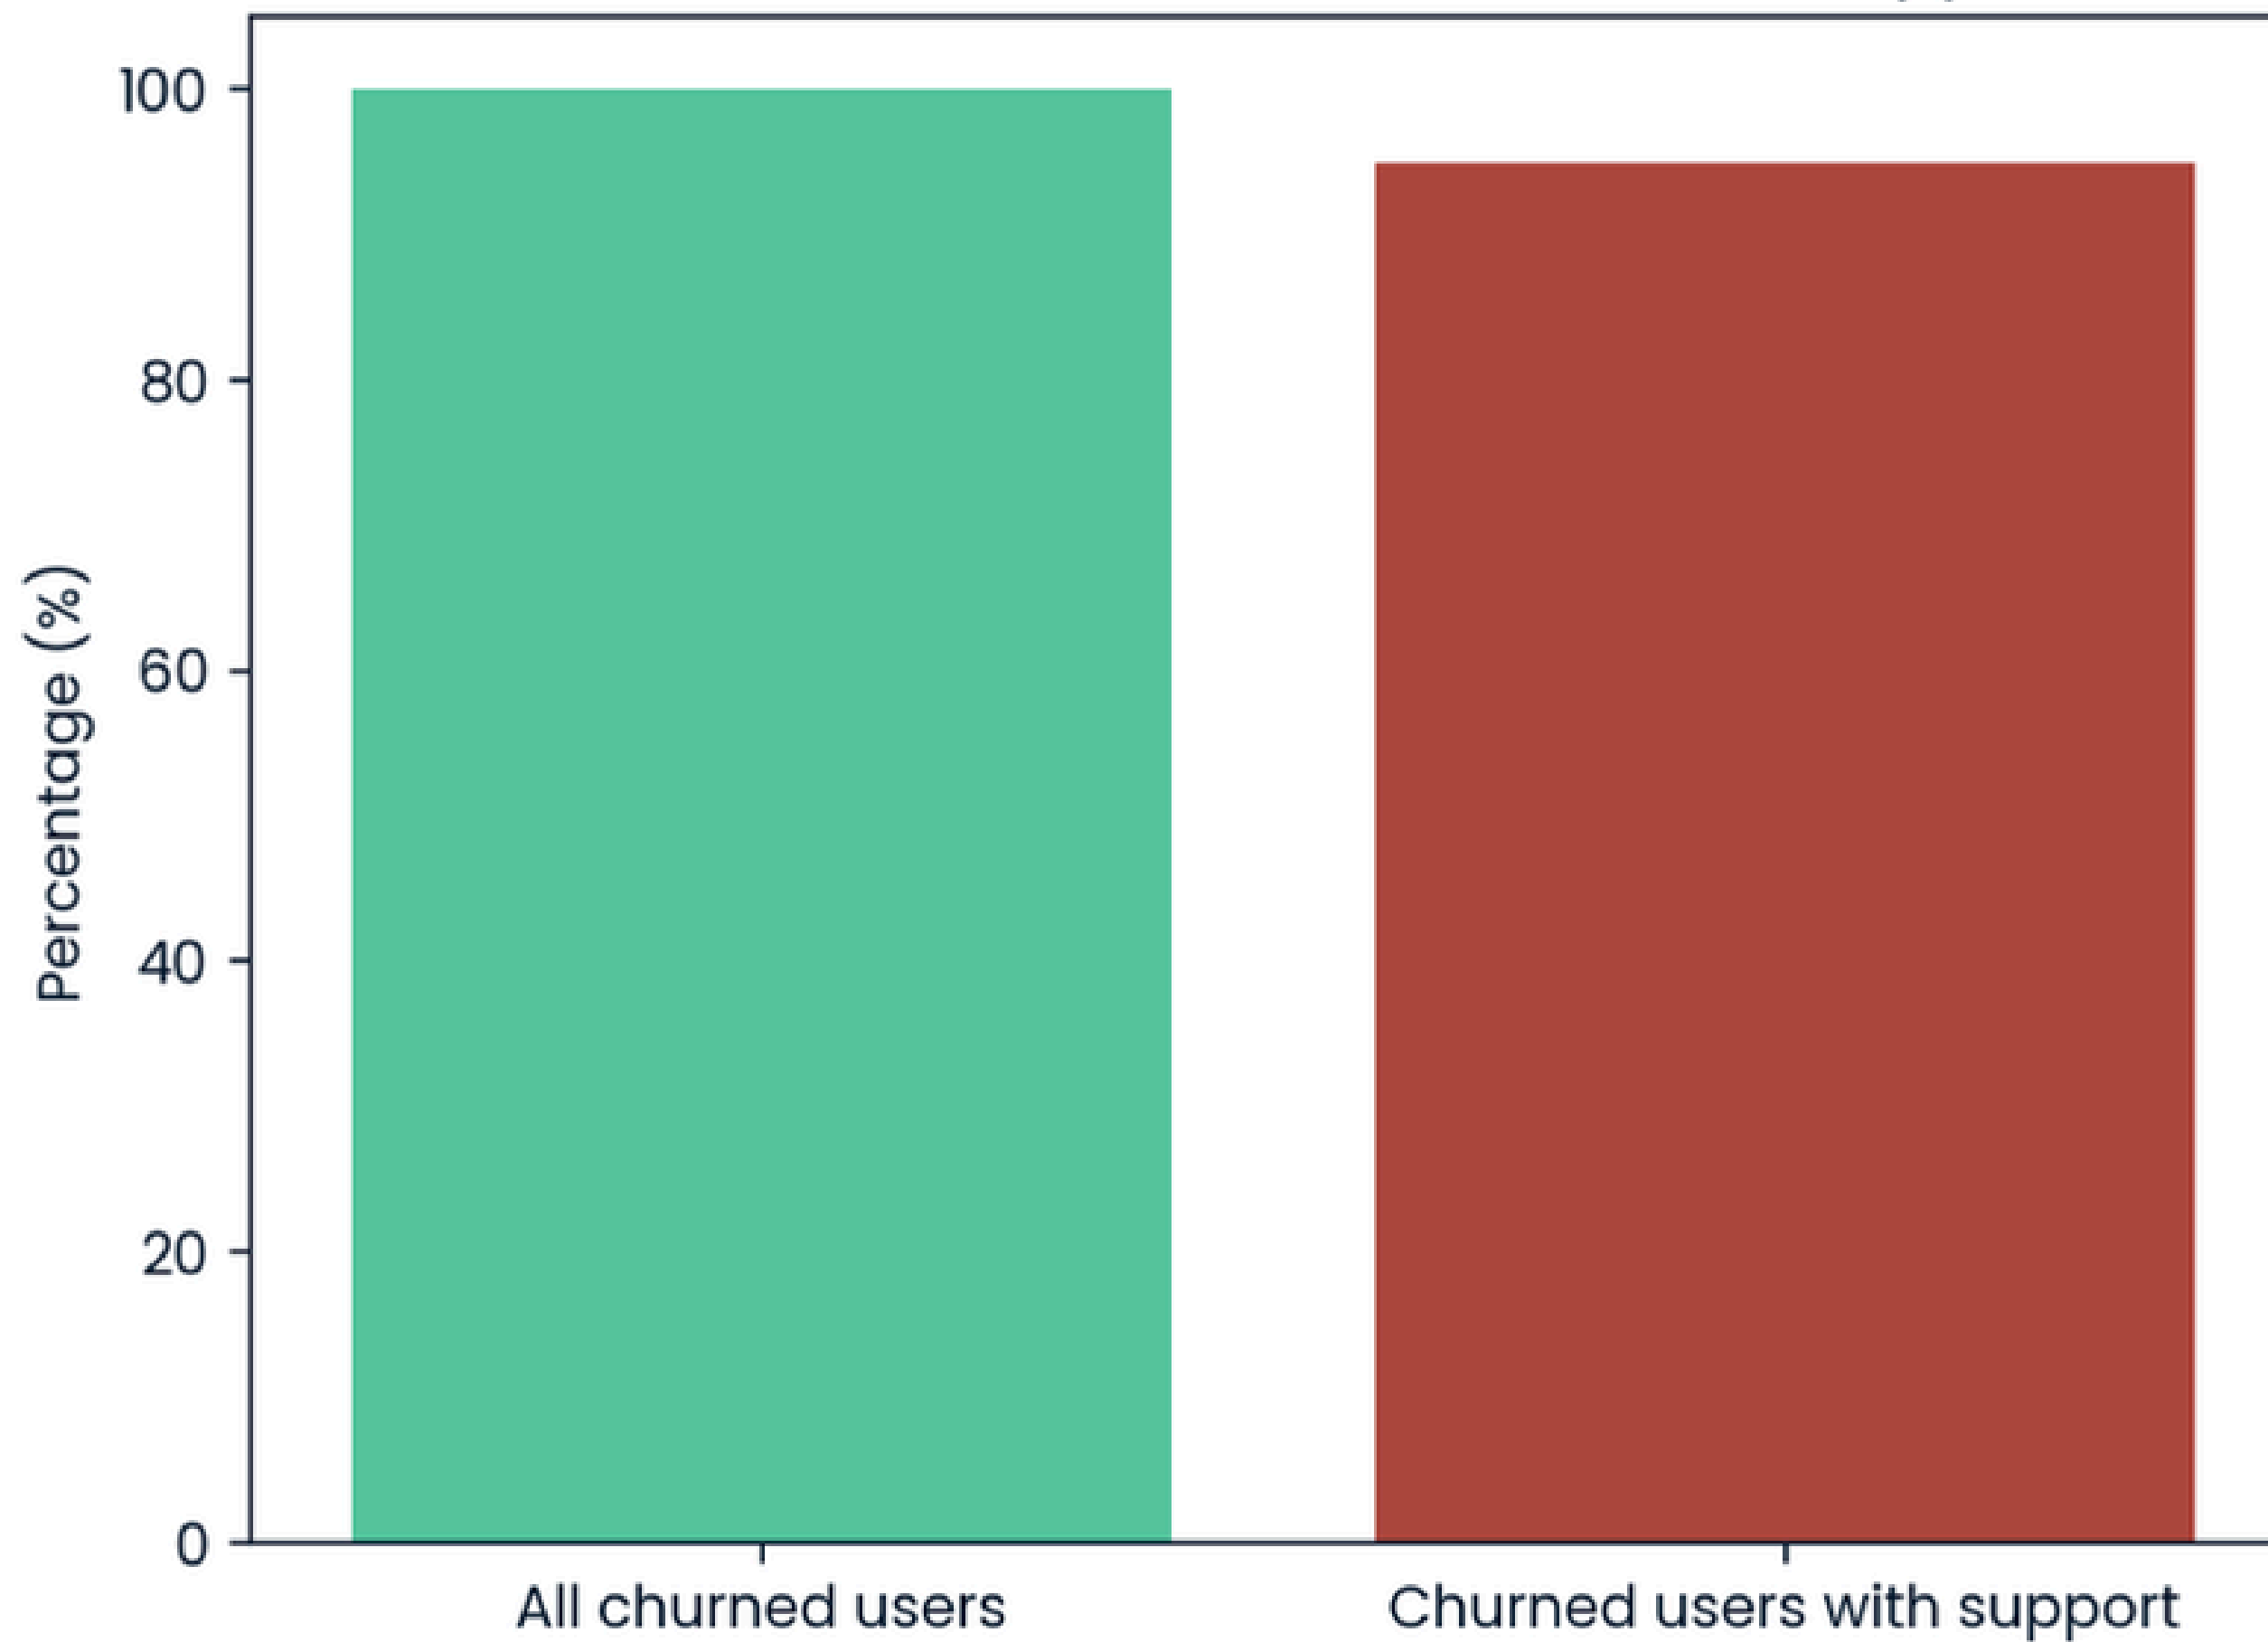

Share of resolved and unresolved tickets

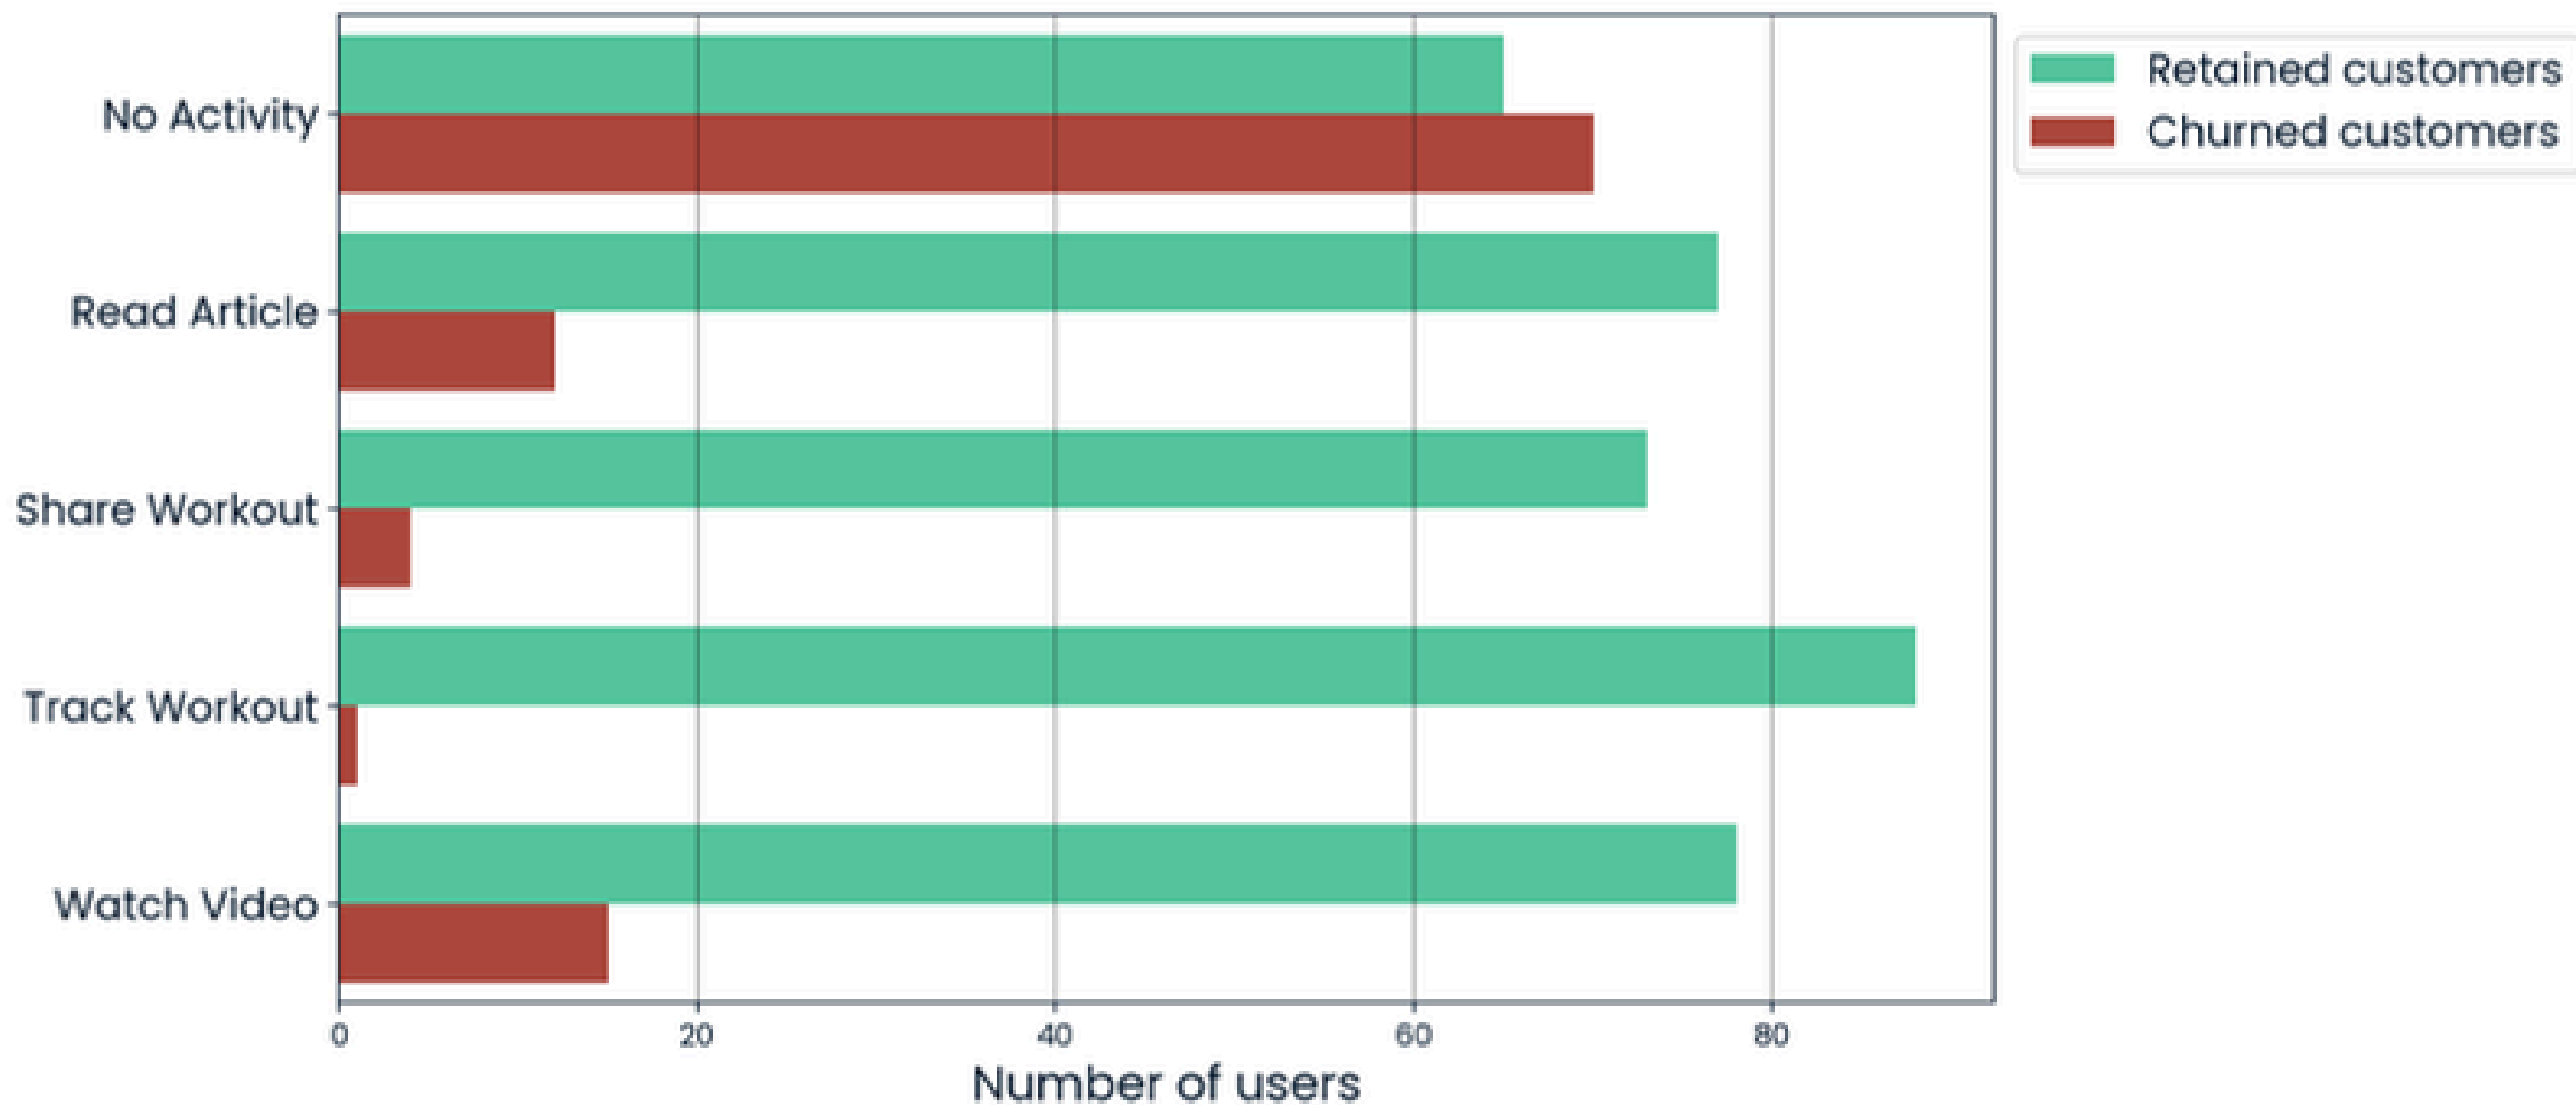

Impact of waiting time on churn (regardless of outcome)

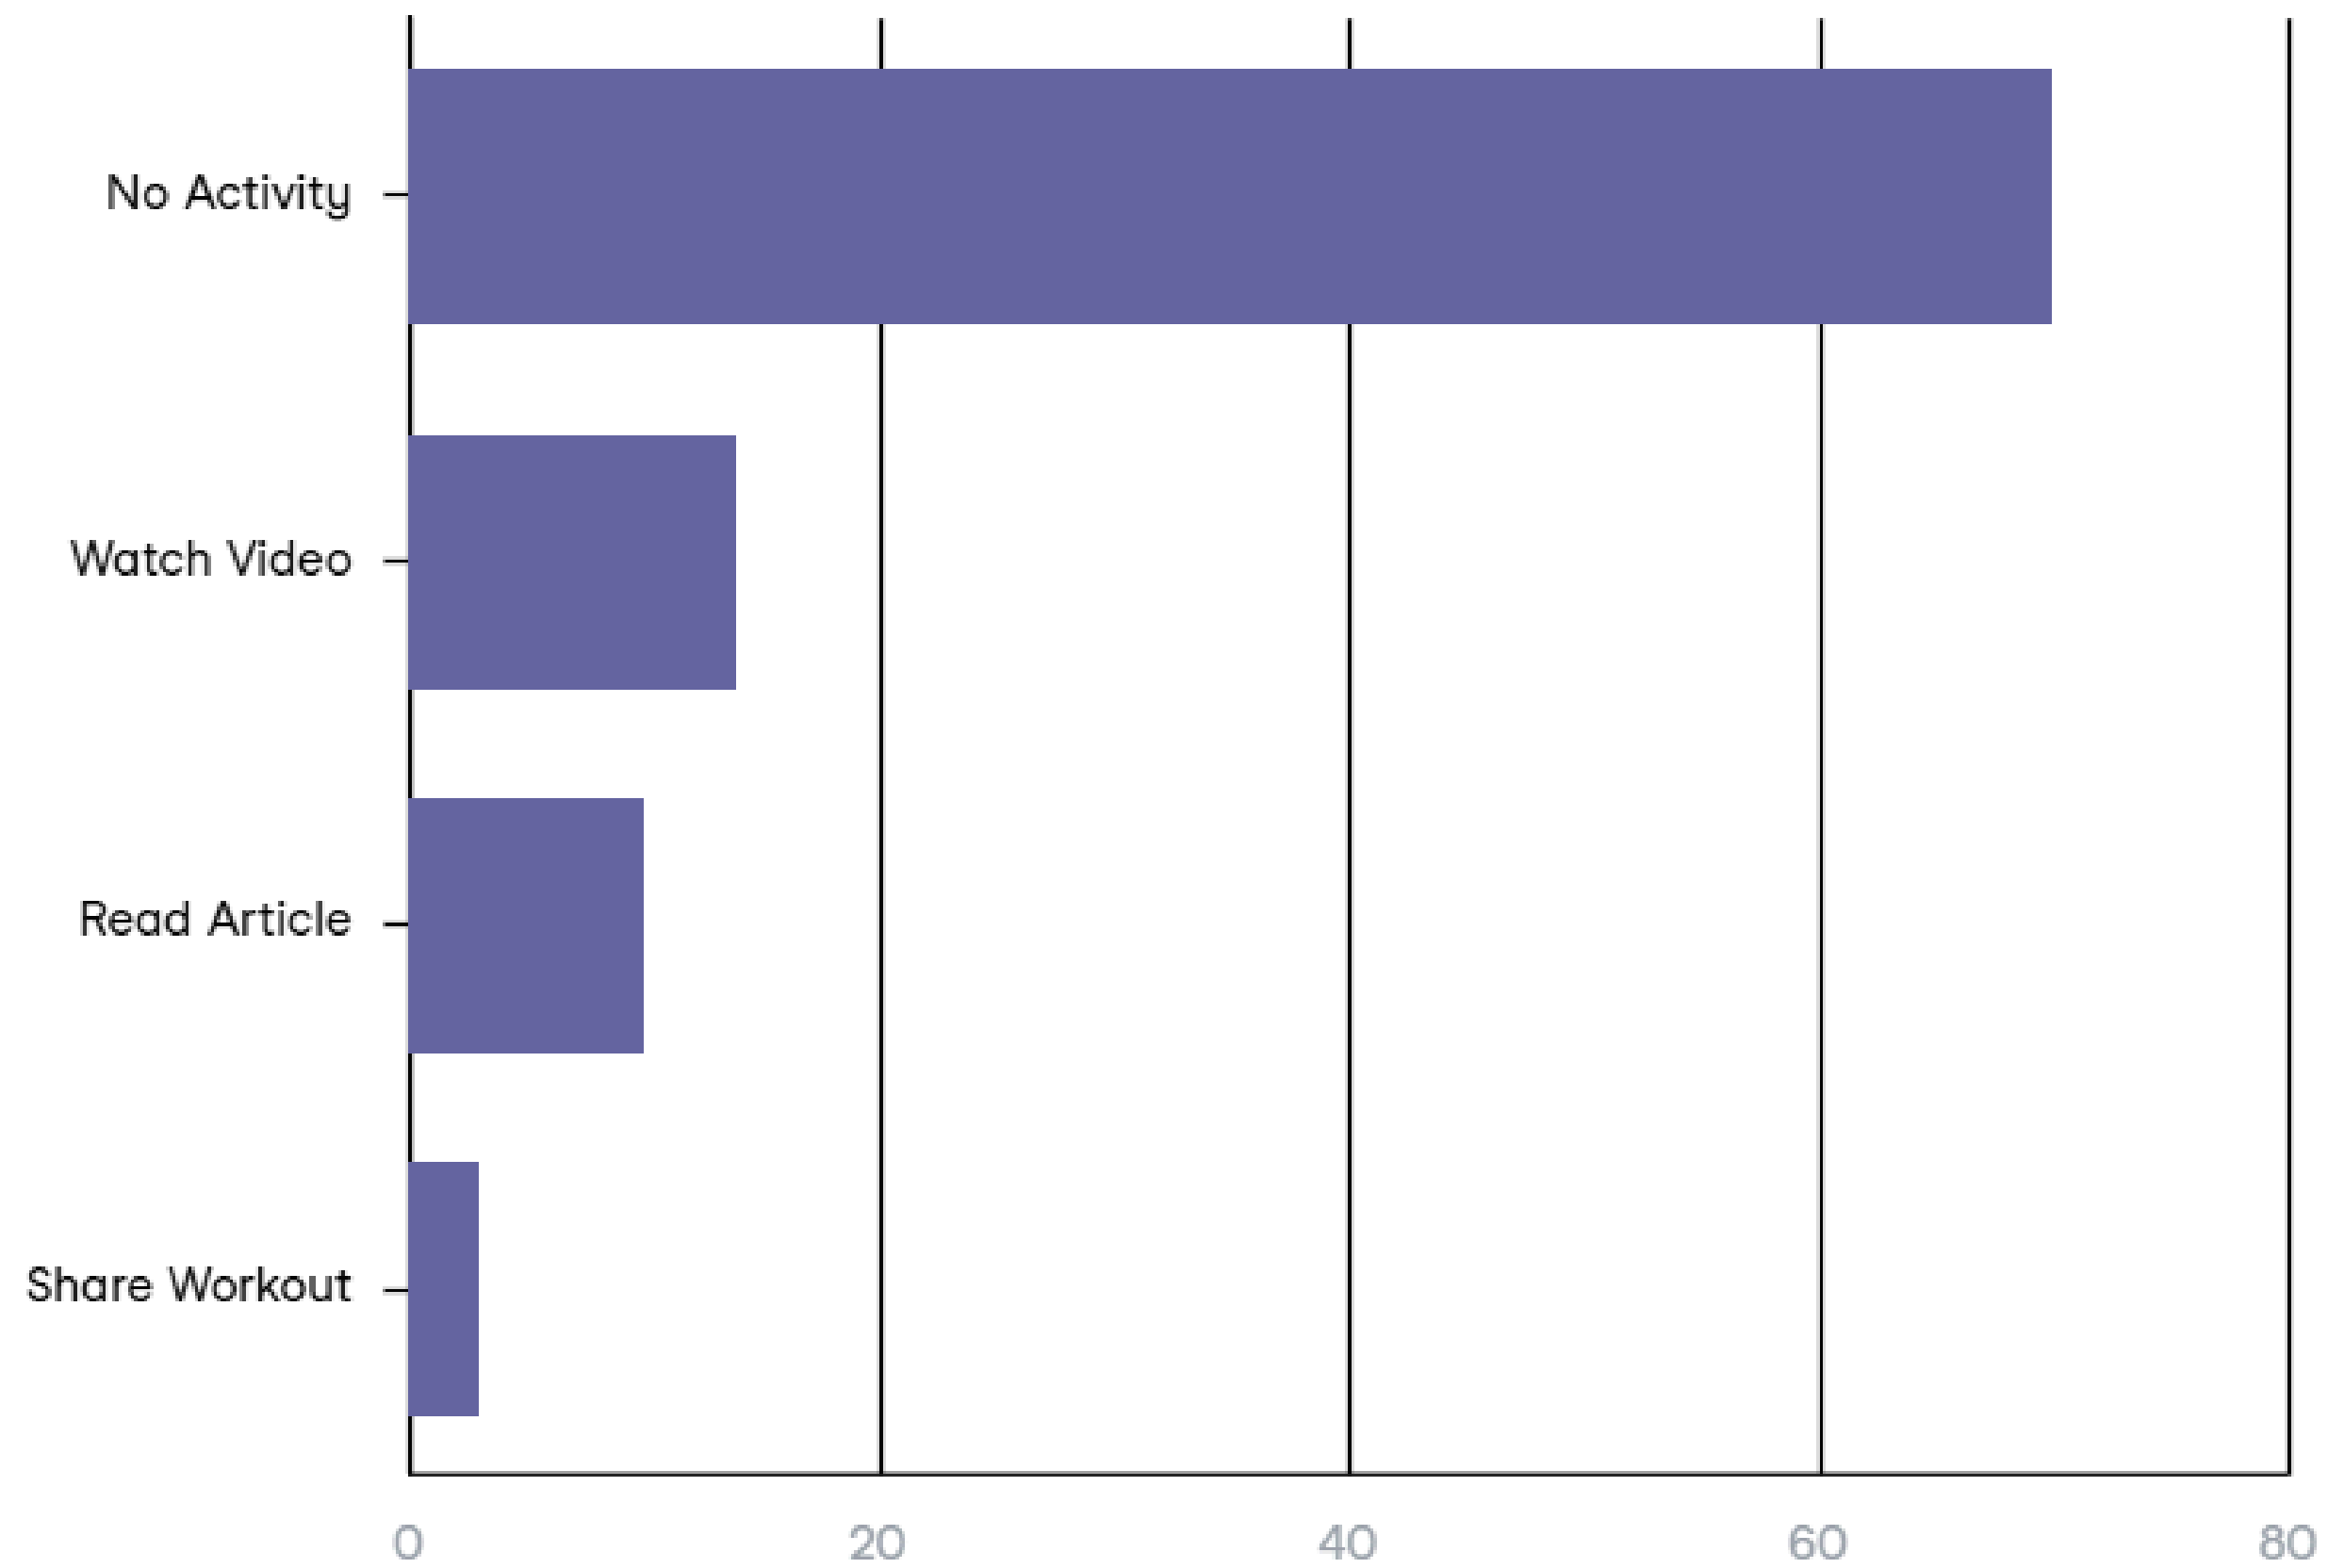

Share of churned users who contacted support

Types of user activity

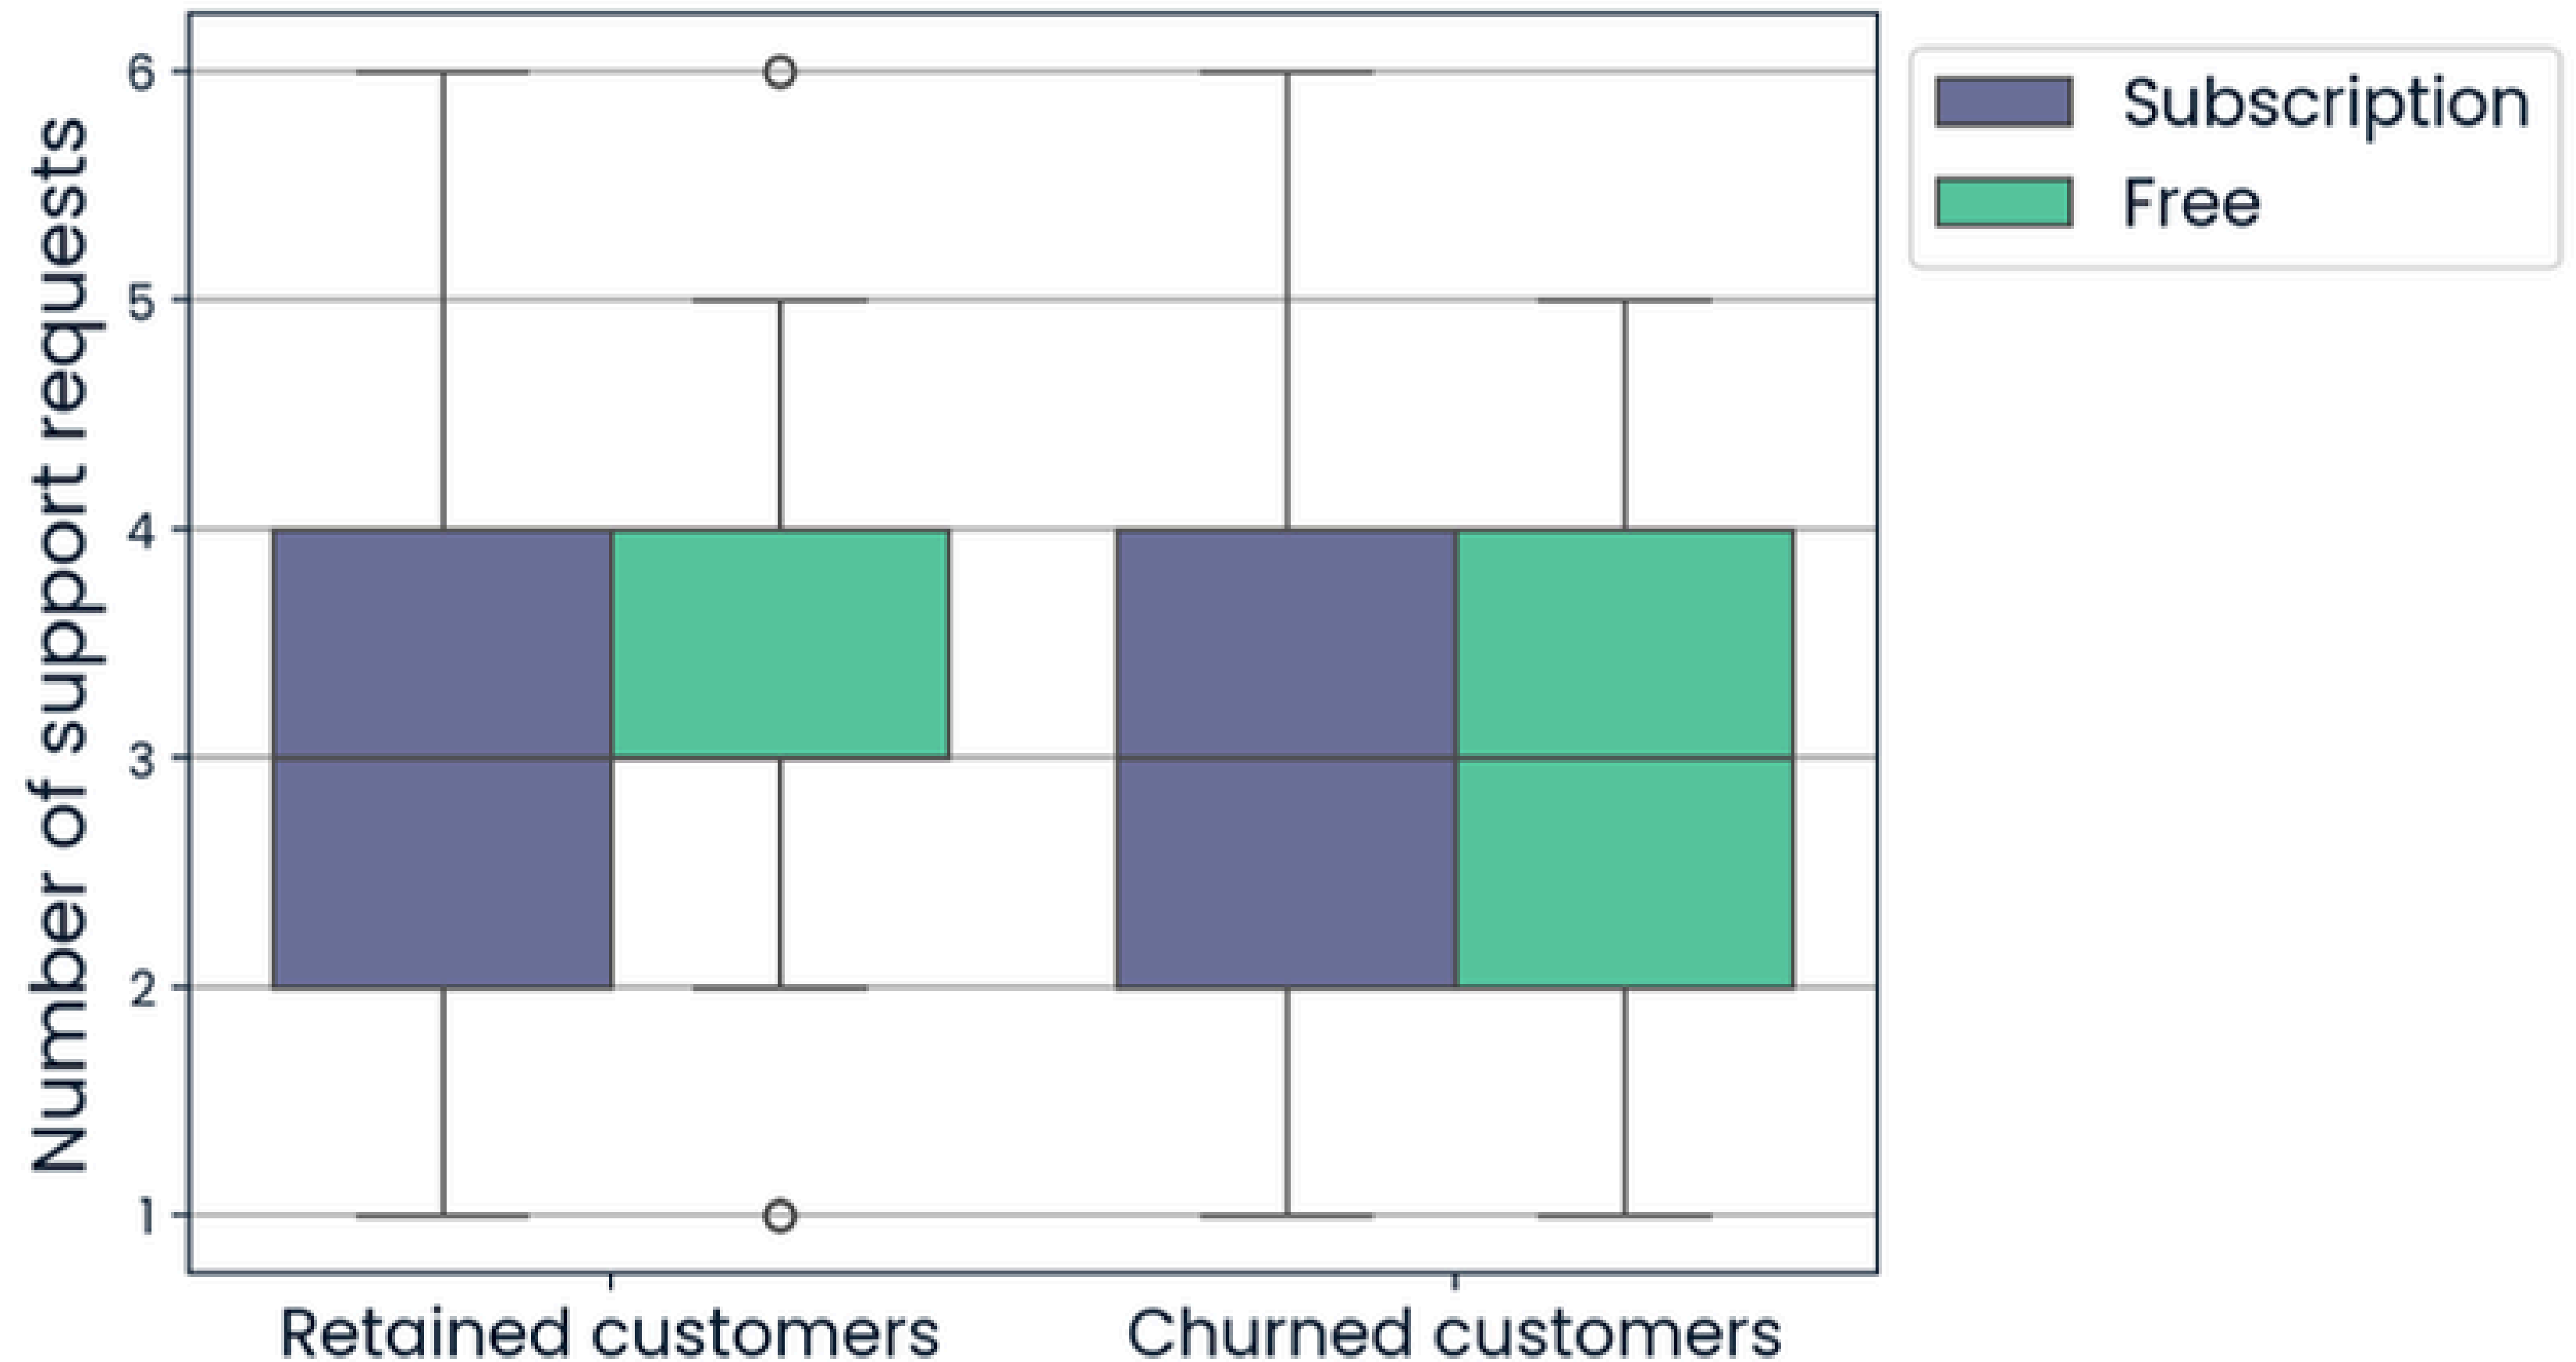

Recent actions of churned users

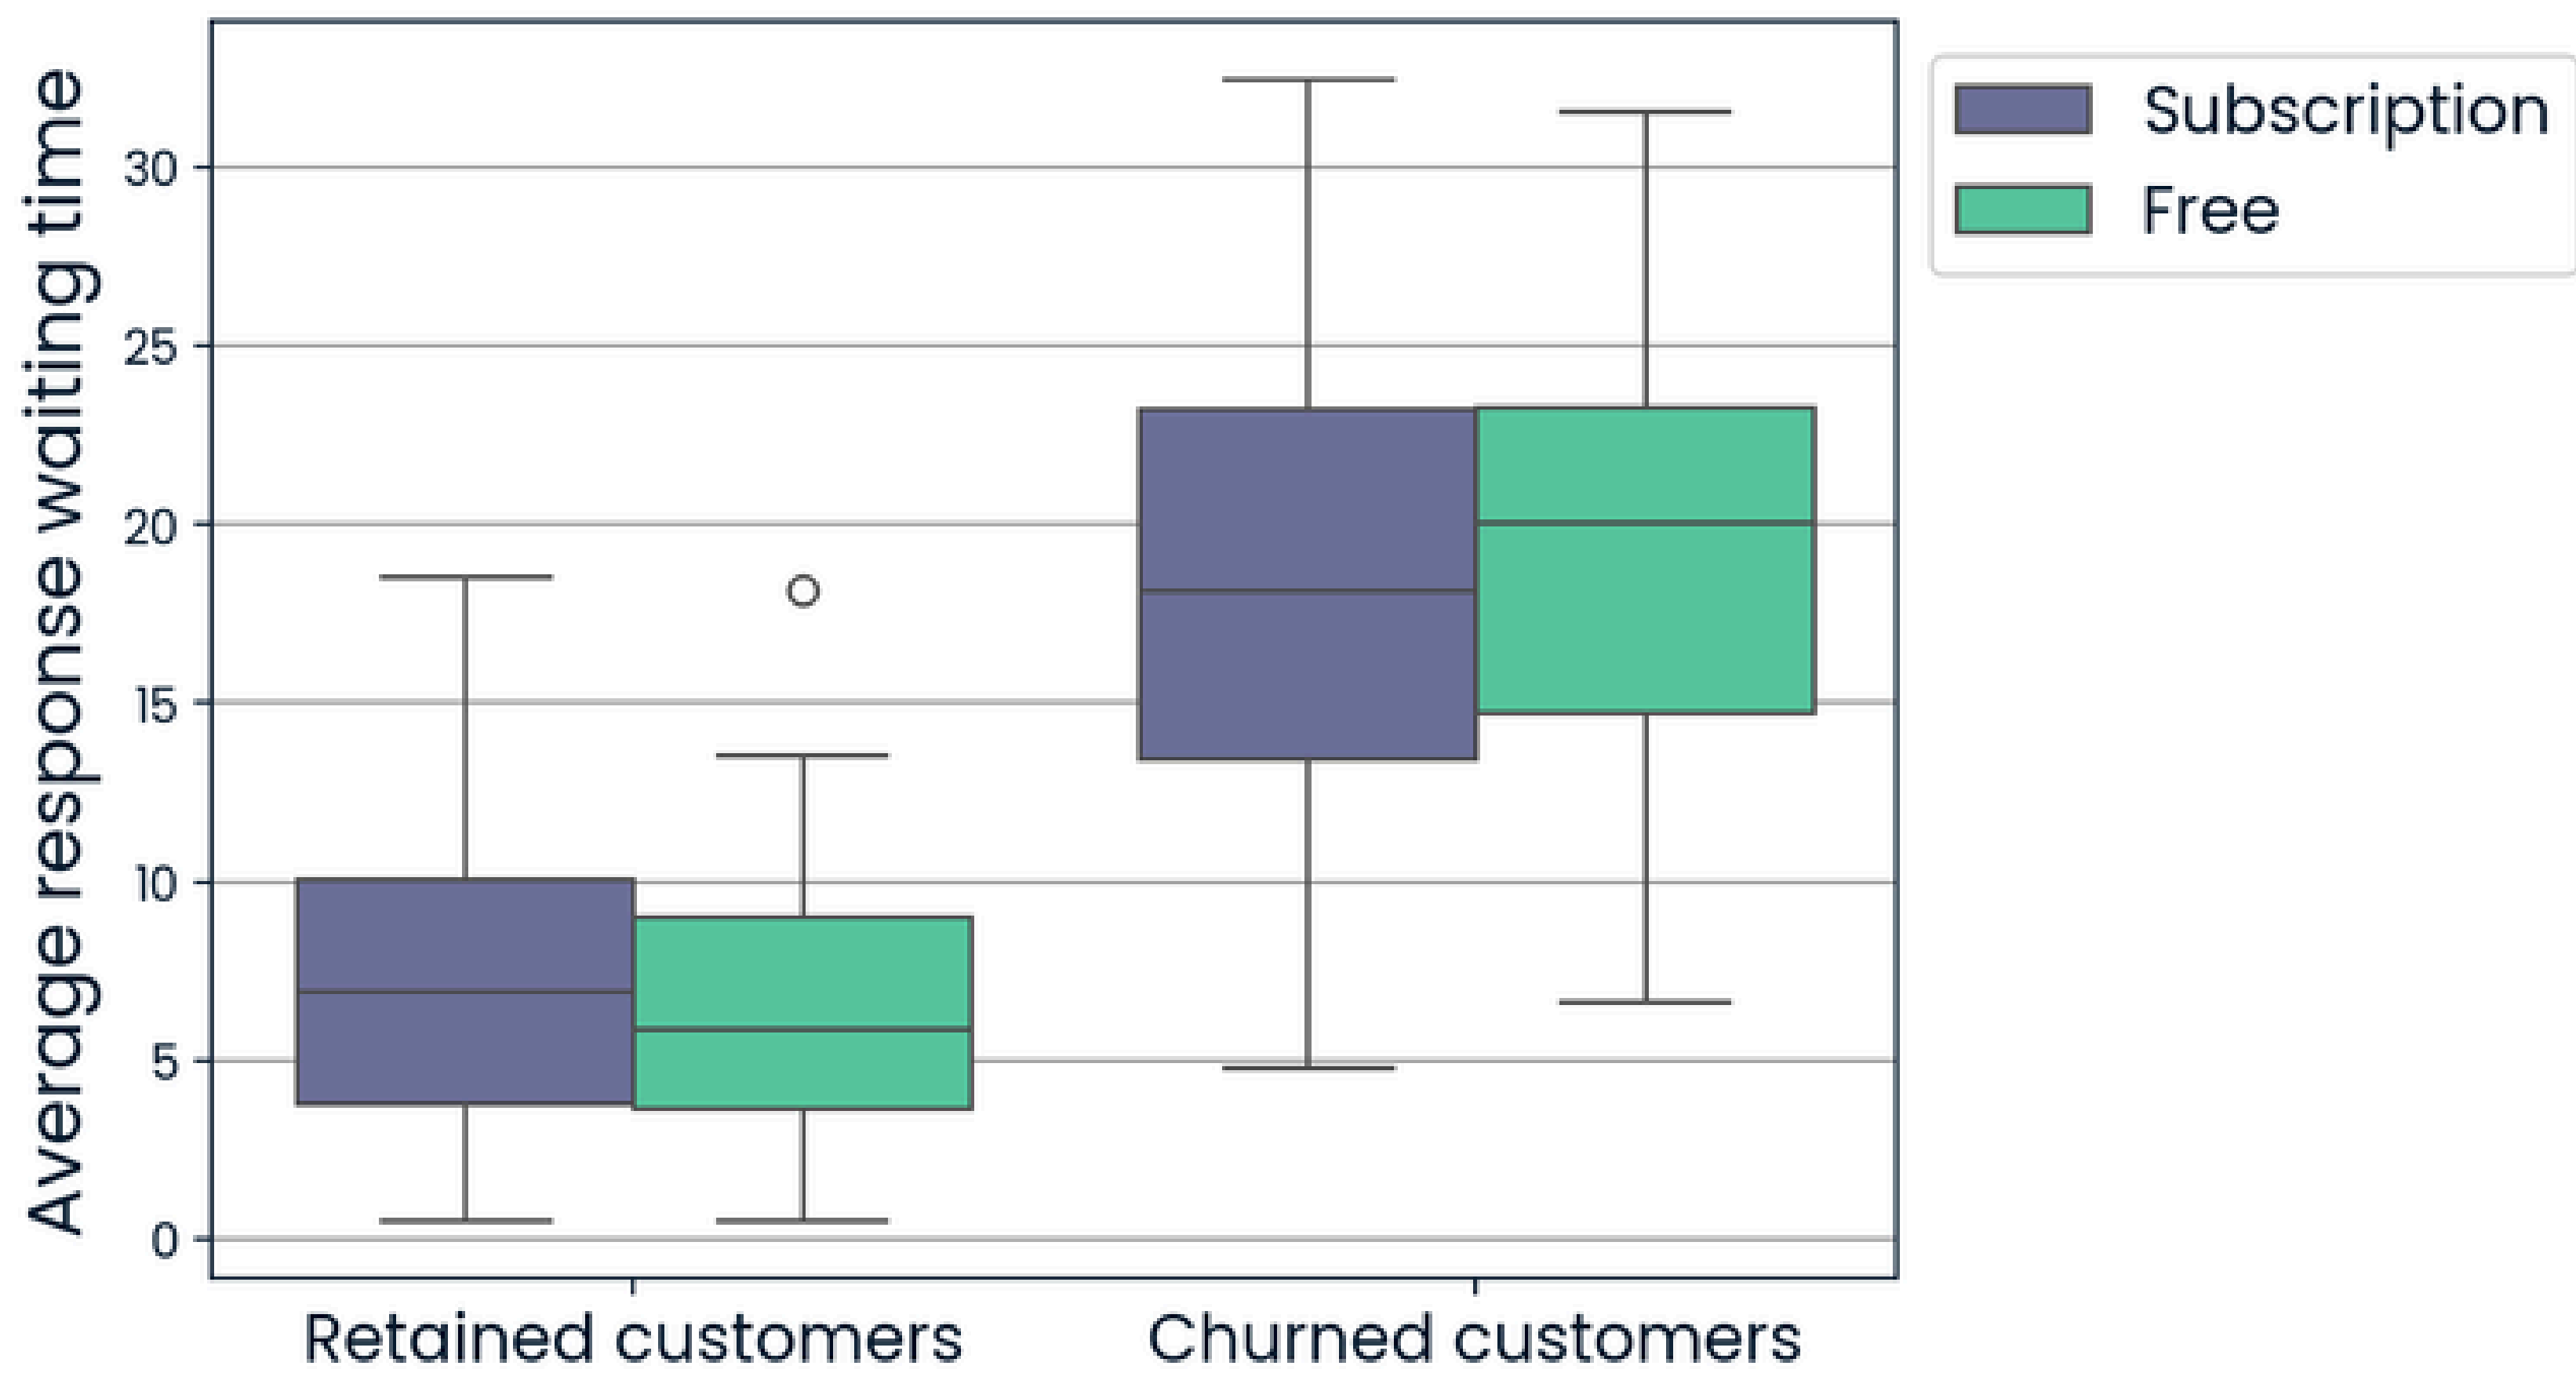

Number of users

Support tickets: churned vs not churned

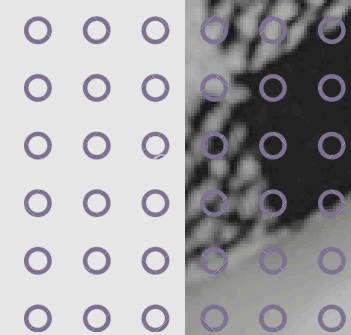

Support operating hours: churned vs not churned

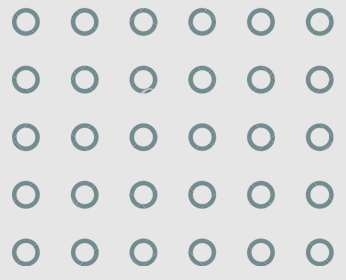

Portrait of a Churned User

- Low early engagement and weak initial activity
- Almost all contacted support ($\approx 95\%$)
- Long support response time ($\approx 18\text{h}$ on average, maximum $24\text{h}+$)
- Little or no activity at all before leaving

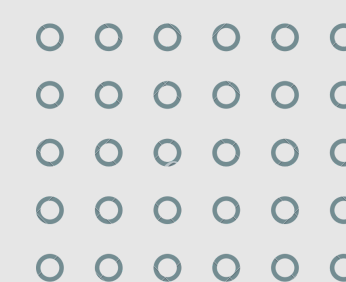

Key Insight

The most critical risk group is inactive new users.

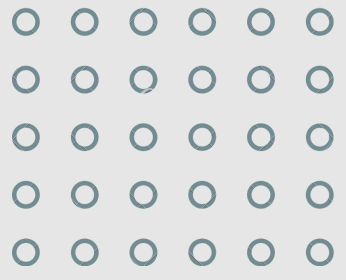

Users who do not complete their first workout are much more likely to churn, meaning the first user experience is a key driver of retention.

Recommendations

- Improve onboarding and first workout flow to reduce friction
- Make the first steps clearer and easier to complete
- Reduce support response time, especially for new users
- Prioritize users who have not completed any actions yet
- Identify and remove blockers in the first workout journey
- Add registration time to activity data for better tracking of early behavior

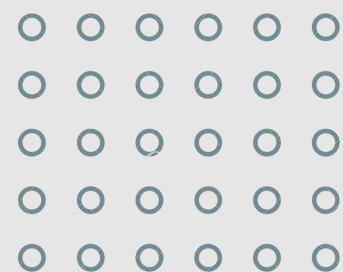

Success Metrics

Main metric:
**Average Resolution
Time (ART)**

Reduce from ~18 hours
to ~6 hours

Product metric:
**Inactive users
rate**

Reduce number of users
who never start a workout
